## 2025 CpSc H Q11

Section: Database Design and Development

Topic: Entity-Relationship Diagrams and Data Modelling

### **Question Summary**

Draw an ERD for a laundry company database with entities Customer, Order, Item, and OrderItem. Show entity names and cardinalities (attributes not required).

#### **Worked Solution**

Interpretation of the schema (based on primary/foreign keys listed):  $\cdot$  A Customer places many Orders  $\rightarrow$  1 Customer: Many Orders (1:M).

- Each Order contains many OrderItems → 1 Order: Many OrderItems (1:M).
- Each Item can appear in many OrderItems  $\rightarrow$  1 Item : Many OrderItems (1:M).

Therefore, Order and Item are in a many-to-many relationship, resolved by the associative entity OrderItem (with its own identifier orderItemID and FKs to both Order and Item).

#### **ERD** (cardinalities)

Customer Order Item
(customerID) (orderID) (itemID)
111
└─── <b>≺</b> MM>──
\
\ /
\ /
\ /
OrderItem (orderItemID, orderID*, itemID*, quantity, price)
MM

### Final Answer

Entities: Customer, Order, Item, OrderItem. Relationships & cardinalities:

- Customer 1 M Order
- Order 1 M OrderItem
- Item 1 M OrderItem

Thus Order M— MItem via OrderItem (associative entity).

# **Revision Tips**

- · Use an associative/bridge entity to resolve many-to-many relationships.
- · Cardinality: 1:1, 1:M, MN (resolved to two 1:M via an associative entity).
- Show only entity names and crow's-foot/1 notation when attributes are not requested.
